

# CONCERT GENETICS GENETIC TESTING: NON-INVASIVE PRENATAL SCREENING (NIPS)

Other common names for this test include: Non-invasive Prenatal Testing (NIPT), Cell-free DNA Testing (cfDNA), Cell-free Fetal DNA Testing (cffDNA)

---

See [Important Reminder](#) at the end of this policy for important regulatory and legal information.

## OVERVIEW

[Non-invasive prenatal screening \(NIPS\)](#) is a [sequencing test](#) performed on placental cell-free DNA found in maternal serum and is most commonly used to screen for fetal aneuploidy (trisomy 21, trisomy 13, and trisomy 18). Sex chromosomes are also screened for fetal sex determination and sex chromosome aneuploidy. NIPS is a screening test and does not provide definitive diagnosis for a fetus. When NIPS is positive, or high risk, for a genetic abnormality, the fetus is at increased risk for that condition. Further testing via karyotype, FISH, or CMA would be necessary to exclude the possibility of a false-positive.

Before testing, guidelines recommend that pregnant people be counseled about the risk of a false-positive result. False-positive findings have been associated with factors, including placental mosaicism, vanishing twin, or a confounding factor within the pregnant person (such as a genetic condition or malignancy).

NIPS has expanded to include microdeletion and microduplication syndromes, as well as single-gene disorders, although this is an area of ongoing research. NIPS has also expanded to predict twin zygosity (i.e., monozygotic versus dizygotic twins). Monozygotic twins have a higher risk for certain complications, such as twin-twin transfusion syndrome (TTTS).

## OTHER RELATED POLICIES

This policy document provides criteria for Non-Invasive Prenatal Screening (NIPS). Please refer to:

- **Oncology: Circulating Tumor DNA and Circulating Tumor Cells (Liquid Biopsy)** for criteria related to circulating tumor DNA (ctDNA) or circulating tumor cell testing performed on peripheral blood for cancer diagnosis, management and surveillance.
- **Genetic Testing: Prenatal Diagnosis (via amniocentesis, CVS, or PUBS) and Pregnancy Loss** for coverage related to prenatal and pregnancy loss diagnostic genetic testing.
- **Genetic Testing: Prenatal and Preconception Carrier Screening** for criteria related to carrier screening for genetic disorders.
- **Genetic Testing: Preimplantation Genetic Testing** for criteria related to genetic testing of embryos prior to in vitro fertilization.
- **Genetic Testing: Multisystem Inherited Disorders, Intellectual Disability, and Developmental Delay** for criteria related to diagnostic genetic testing in the postnatal period.
- **Genetic Testing: General Approach to Genetic and Molecular Testing** for criteria related to non-invasive prenatal screening that is not specifically discussed in this or other non-general policies.

## CRITERIA

It is the policy of Coordinated Care of Washington, Inc., that the specific genetic testing noted below is **medically necessary** when meeting the related criteria:

## **Non-invasive Prenatal Screening (NIPS) for Chromosome 13, 18, 21, X and Y Aneuploidies**

- I. Noninvasive Prenatal Screening (NIPS) for 13, 18, 21, X and Y aneuploidy (81420, 81507, 0327U) may be considered **medically necessary** for Apple Health members/enrollees when:
  - A. The member/enrollee has a singleton pregnancy, **AND**
  - B. The member/enrollee has NOT previously had cell-free DNA screening in the current pregnancy
  - C. The member/enrollee has received appropriate counseling about the benefits and limitations of this test by a prenatal care provider, a trained designee or a genetic counselor, **AND** one of the following:
    1. Pregnant member is age 35 years or older at the time of delivery,
    2. History of a prior pregnancy with a trisomy or aneuploidy
    3. Family history of aneuploidy (first degree relatives or multiple generations affected)
    4. Positive first or second trimester standard biomarker screening test for aneuploidy, including sequential, or integrated screen, or a positive quadruple screen,
    5. Parental balanced Robertsonian translocation with increased risk for fetal T13 or T21
    6. Finding indicating an increased risk of aneuploidy
- II. NIPS to predict [twin zygosity](#) (0060U) is considered **investigational**.
- III. NIPS is considered **investigational** for all other indications, including the following:
  - A. For all other aneuploidies (other than trisomy 13, 18, and 21)
  - B. For multiple gestation pregnancies (triplets or higher)
  - C. NIPS performed simultaneously with maternal serum screening
  - D. Use on a singleton pregnancy with a known vanishing twin
  - E. For the sole purpose of fetal sex determination

[back to top](#)

## Non-invasive Prenatal Screening (NIPS) for Microdeletions

1. NIPS for microdeletion and microduplications (81422, 0060U) is considered **investigational**.

[back to top](#)

## Non-invasive Prenatal Screening (NIPS) for Single-gene Disorders

1. NIPS for mutations associated with single gene disorders (81302, 81404, 81405, 81406, 81407, 81408, 81442) is considered **investigational**.

[back to top](#)

## Maternal Serum Screening (MSS)

1. Maternal serum screening for aneuploidy using no more than one of the following one time per pregnancy is considered **medically necessary**:
  - A. First trimester screening (free or total beta-HCG and PAPP-A) (81508)
  - B. Second trimester screening (hCG, msAFP, uE3, and DIA) (81509, 81510, 81511, 81512)
  - C. Integrated, stepwise sequential, or contingent sequential screening (81508, 81509, 81510, 81511, 81512)
  - D. Penta screen (hCG, msAFP, uE3, DIA, ITA) (81512)

[back to top](#)

## NOTES AND DEFINITIONS

1. **Noninvasive prenatal screening (NIPS)** is a screening test that is used to determine the risk of specific genetic disorders by analyzing traces of cell-free DNA (cfDNA) in a pregnant woman's blood.

2. **Sequencing-based tests** use 1 of 2 general approaches to analyze cell-free DNA. The most widely used technique to date uses massively parallel sequencing (MPS; also known as next-generation or “next gen” sequencing). The second general approach uses the single nucleotide polymorphism (SNP) method.
3. **Singleton pregnancy** is a pregnancy with one fetus.
4. **Twin Zygosity** testing is used to predict the degree of genetic similarity within each pair (i.e., monozygotic versus dizygotic). Monozygotic (genetically identical twins) are at a higher risk for pregnancy complications, such as twin-twin transfusion syndrome (TTTS).

## BACKGROUND AND RATIONALE

### Non-invasive Prenatal Screening (NIPS) for Chromosome 13, 18, 21, X and Y Aneuploidy

*American College of Obstetricians and Gynecologists (ACOG) and Society for Maternal-Fetal Medicine (SMFM)*

ACOG and SMFM (2020) released a joint practice bulletin (No. 226) with the following recommendations for screening for fetal chromosomal abnormalities:

The following recommendations and conclusions are based on good and consistent scientific evidence (Level A):

- Cell-free DNA is the most sensitive and specific screening test for the common fetal aneuploidies. Nevertheless, it has the potential for false-positive and false-negative results. Furthermore, cell-free DNA testing is not equivalent to diagnostic testing. (p. e63)

The following recommendations and conclusions are based on limited and inconsistent scientific evidence (Level B):

- Cell-free DNA screening can be performed in twin pregnancies. Overall, performance of screening for trisomy 21 by cell-free DNA in twin pregnancies is encouraging, but the total number of reported affected cases is small. Given the small number of affected cases it is difficult to determine an accurate detection rate for trisomy 18 and 13. (p. e64)

Regarding prenatal screening for multiple gestation pregnancies of triplets or higher, Practice Bulletin No. 226 also states: “...there are no data available for serum screening for higher-order multiple gestations such as triplets and quadruplets.” (p. e59)

Regarding screening a pregnancy with a vanishing twin: “In a patient with both a vanishing twin and a viable intrauterine pregnancy, cell-free DNA screening is not advised because of the high risk for aneuploidy in the nonviable sac or embryo, which can lead to false-positive results.” (p. e53)

The Practice Bulletin No. 226 also notes that “[i]f screening is accepted, patients should have one prenatal screening approach, and should not have multiple screening tests performed simultaneously.” (p. e49)

#### *American College of Medical Genetics and Genomics (ACMG)*

ACMG (2016) published a position statement on noninvasive prenatal screening (NIPS) for fetal aneuploidy.

ACMG recommends:

- Informing all pregnant women that NIPS is the most sensitive screening option for traditionally screened aneuploidies (i.e., T13, T18, and T21). (page 1059)
- Referring patients to a trained genetics professional when an increased risk of aneuploidy is reported after NIPS. (page 1059)
- Providers should make efforts to deter patients from selecting sex chromosome aneuploidy screening for the sole purpose of biologic sex identification in the absence of a clinical indication for this information (p. 1060)

Current ACMG practice guidelines (2022) “strongly recommends NIPS over traditional screening for all pregnant patients with singleton and twin gestations for fetal trisomies 21, 18, and 13 and strongly recommends NIPS be offered to patients to screen for fetal sex chromosome aneuploidy.” (p. 1 and p. 5)

#### *National Society for Genetic Counselors (NSGC)*

The National Society for Genetic Counselors adopted the following statement updated in 2021 supporting prenatal cell-free DNA (cfDNA) screening as an option for pregnant patients:

The National Society of Genetic Counselors believes that all pregnant patients, regardless of aneuploidy risk, should have access to prenatal aneuploidy screening using cell-free DNA (cfDNA)\*. Healthcare providers should present cfDNA screening for aneuploidy within the context of other available prenatal screening and diagnostic testing options.

Included in this discussion should be the option of pursuing diagnostic testing as a first line approach or declining all screening/testing. Pretest counseling should also include a discussion of the individual patient's values, preferences, and needs, as well as the benefits and limitations of cfDNA screening. Many factors influence cfDNA screening performance; therefore, it may not be appropriate for every clinical scenario. Additionally, some laboratories offer screening for conditions beyond common aneuploidies, so it is essential to consider the test's positive predictive value, particularly when the prevalence of the disorder is low.

Patients who receive increased risk or inconclusive/atypical results should receive post-test genetic counseling with a knowledgeable healthcare provider, such as a genetic counselor. In such cases, confirmatory diagnostic testing may be indicated, and patients should be counseled that no irreversible actions should be taken based on the cfDNA screening alone.

### **Non-invasive Prenatal Screening (NIPS) for Microdeletions**

*American College of Obstetricians and Gynecologists (ACOG) and Society for Maternal-Fetal Medicine (SMFM)*

ACOG and SMFM (2020) released a joint practice bulletin (No. 226) with the following recommendations for screening for fetal chromosomal abnormalities:

Screening for a limited number of microdeletions with cell-free DNA is available; however, this testing has not been validated clinically and is not recommended. Although microdeletions are relatively common when considered in aggregate, cell-free DNA panels only include a few specific clinically significant microdeletions and these are very rare. Therefore, the PPV for these disorders is much lower than for common trisomies. (p. e53)

*American College of Medical Genetics (ACMG)*

The ACMG practice guideline from 2023 includes a conditional recommendation, suggesting 22q11.2 deletion syndrome be offered to all patients. The guideline defines a conditional recommendation as follows: "most patients would request this testing and most clinicians would offer NIPS for this purpose, after a discussion about the benefits and limitations of screening and in the context of shared-decision making." (p. 19)

Furthermore, the ACMG statement discusses a study (Dar, et al, 2022) that assessed the performance of SNP-based NGS and included more than 18,000 subjects. Results of the analysis demonstrated a 0.05% false positive rate and a 52.6% positive predictive value. (pages 5-6). Specifically, the study quoted a positive predictive value of 21% for DiGeorge syndrome. (Petersen, et al 2017, p. 691.e1 and e4). However, studies attempting to validate the clinical utility of microdeletion analysis via NIPS have overall shown low positive predictive values and higher false positive rates, likely because of the low prevalence of the individual targeted microdeletion syndromes in the general population.

At the present time, testing for microdeletions, including 22q11.2, via non-invasive prenatal screening has **insufficient** evidence in peer-reviewed publications to effectively result in improved health outcomes compared to the current standard of care. Further studies are needed to determine the sensitivity and specificity of the test.

### **Non-invasive Prenatal Screening (NIPS) for Single Gene Disorders**

*The American College of Obstetricians and Gynecologists (ACOG)*

ACOG issued a practice advisory for the use of cell-free DNA to screen for single-gene disorders (February 2019, reaffirmed October 2022), which states the following:

The continued innovation in cell-free technology combined with the desire for a maternal blood test to predict the risk for fetal genetic disorders during a pregnancy has broadened the application of cell-free DNA screening beyond aneuploidy to single-gene disorders. Examples of single-gene disorders include various skeletal dysplasias, sickle cell disease and cystic fibrosis. Although this technology is available clinically and marketed as a single-gene disorder prenatal screening option for obstetric care providers to consider in their practice, often in presence of advanced paternal age, there has not been sufficient data to provide information regarding accuracy and positive and negative predictive value in the general population. For this reason, single-gene cell-free DNA screening is not currently recommended in pregnancy.

### **Maternal Serum Screening**

*The American College of Obstetricians and Gynecologists (ACOG)*

The American College of Obstetricians and Gynecologists (ACOG) provided an updated position statement (number 226) regarding Screening for Fetal Chromosomal Abnormalities.

Specifically, these guidelines state: “Prenatal genetic screening (serum screening with or without nuchal translucency [NT] ultrasound or cell-free DNA screening) and diagnostic testing (chorionic villus sampling [CVS] or amniocentesis) options should be discussed and offered to all pregnant women regardless of maternal age or risk of chromosomal abnormality.” (p. 862)

The use of multiple screening approaches performed independently (e.g., a first-trimester screening test followed by a quad screen as an unlinked test) is not recommended because it will result in an unacceptably high positive screening rate and could deliver contradictory results. (p. 865)

Reviews, Revisions, and Approvals	Revision Date	Approval Date
Policy developed and modified to reflect Health Care Authority guidelines on serum marker screening for fetal aneuploidy.	05/23	05/23
Semi-annual review. Updated title to reflect V1.2024 version. Overview, coding, reference-table, background and references updated. Throughout policy: replaced “coverage criteria” with “criteria. For Overview: added “via karyotype, FISH, or CMA”; added “Before testing, guidelines recommend...”; removed “recently”. For Policy Reference Table: under Non-invasive Prenatal Screening (NIPS) for Chromosome 13, 18, 21, X and Y Aneuploidies added “with or without twin zygosity testing”; added “twin zygosity only”; added “Prenatal Test”; under Non-invasive Prenatal Screening (NIPS) for Microdeletions replaced “with microdeletion syndromes” with “Extended Panel”; removed “81420”; added “twin zygosity only”; under Non-invasive Prenatal Screening (NIPS) for Single-Gene Disorders added “81405”. For Other Related Policies: added “and Molecular”. For Criteria; Non-invasive Prenatal Screening (NIPS) for Chromosome 13, 18, 21, X and Y Aneuploidies: under I. removed “trisomy”; under I.B. removed “received appropriate counseling...”; added “NOT previously had cell-free DNA...”; under III. Added “B. For multiple gestation pregnancies...”. For Notes and Definitions: removed “Clinical Considerations...”. For Background and Rationale: added “American College of Medical Genetics (ACMG)...”; under Non-invasive Prenatal Screening (NIPS) for Single Gene Disorders: replaced “March 2020” with “October 2022”; under Maternal Serum Screening: removed “All women should be offered...”; added “The American College of Obstetricians...”.	10/23	11/23

### **Important Reminder**

This clinical policy has been developed by appropriately experienced and licensed health care professionals based on a review and consideration of currently available generally accepted standards of medical practice; peer-reviewed medical literature; government agency/program approval status; evidence-based guidelines and positions of leading national health professional

organizations; views of physicians practicing in relevant clinical areas affected by this clinical policy; and other available clinical information. The Health Plan makes no representations and accepts no liability with respect to the content of any external information used or relied upon in developing this clinical policy. This clinical policy is consistent with standards of medical practice current at the time that this clinical policy was approved. “Health Plan” means a health plan that has adopted this clinical policy and that is operated or administered, in whole or in part, by Centene Management Company, LLC, or any of such health plan’s affiliates, as applicable.

The purpose of this clinical policy is to provide a guide to medical necessity, which is a component of the guidelines used to assist in making coverage decisions and administering benefits. It does not constitute a contract or guarantee regarding payment or results. Coverage decisions and the administration of benefits are subject to all terms, conditions, exclusions and limitations of the coverage documents (e.g., evidence of coverage, certificate of coverage, policy, contract of insurance, etc.), as well as to state and federal requirements and applicable Health Plan-level administrative policies and procedures.

This clinical policy is effective as of the date determined by the Health Plan. The date of posting may not be the effective date of this clinical policy. This clinical policy may be subject to applicable legal and regulatory requirements relating to provider notification. If there is a discrepancy between the effective date of this clinical policy and any applicable legal or regulatory requirement, the requirements of law and regulation shall govern. The Health Plan retains the right to change, amend or withdraw this clinical policy, and additional clinical policies may be developed and adopted as needed, at any time.

This clinical policy does not constitute medical advice, medical treatment or medical care. It is not intended to dictate to providers how to practice medicine. Providers are expected to exercise professional medical judgment in providing the most appropriate care, and are solely responsible for the medical advice and treatment of members/enrollees. This clinical policy is not intended to recommend treatment for members/enrollees. Members/enrollees should consult with their treating physician in connection with diagnosis and treatment decisions.

Providers referred to in this clinical policy are independent contractors who exercise independent judgment and over whom the Health Plan has no control or right of control. Providers are not agents or employees of the Health Plan.

This clinical policy is the property of the Health Plan. Unauthorized copying, use, and distribution of this clinical policy or any information contained herein are strictly prohibited. Providers, members/enrollees and their representatives are bound to the terms and conditions expressed herein through the terms of their contracts. Where no such contract exists, providers, members/enrollees and their representatives agree to be bound by such terms and conditions by providing services to members/enrollees and/or submitting claims for payment for such services.

**Note: For Medicaid members/enrollees**, when state Medicaid coverage provisions conflict with the coverage provisions in this clinical policy, state Medicaid coverage provisions take precedence. Please refer to the state Medicaid manual for any coverage provisions pertaining to this clinical policy.
